

WHAT IS CLAIMED IS:

1. A system for remotely programming a memory comprising:
a host system for developing code;
a wireless transmitter associated with the host system for transmitting the code;
a wireless receiver associated with the memory for receiving the transmitted code; and
circuitry for storing the received code in the memory.
2. The system of Claim 1 wherein the memory comprises Flash memory.
3. The system of Claim 1 wherein the wireless transmitter comprises an RF transmitter and the wireless receiver comprises an RF receiver.
4. The system of Claim 1 wherein the wireless transmitter comprises an IR transmitter and the wireless receiver comprises an IR receiver.
5. The system of Claim 1 wherein the wireless transmitter transmits the code in a format emulating a wired connection between the host system and the circuitry for storing.
6. The system of Claim 1 wherein the circuitry for storing the received code is integrated with the memory.

ATTORNEY DOCKET NO.
1102-GA

PATENT

7. The system of Claim 1 wherein the wireless receiver is integrated with the memory.

2836- P137US

8. A system comprising:
a processor operating in response to code programmed into an associated Flash memory;
a wireless receiver for receiving the code from a remote development system;
and
circuitry for programming the code received by the wireless receiver into the Flash memory.

9. The system of Claim 8 wherein the processor and the flash memory are disposed on a development board.

10. The system of Claim 8 wherein the processor and the flash memory are disposed on a production board.

11. The system of Claim 8 wherein the processor forms a portion of a system-on-a-chip.

12. The system of Claim 8 wherein the circuitry for programming is integrated with the flash memory.

13. The system of Claim 11 wherein the circuitry for programming is integrated into the system-on-a-chip.

PATENT

[illegible]

15. A method of remotely programming a memory associated with a wireless receiver and circuitry for storing code received by the wireless receiver in the memory comprising the steps of:

developing the code on a simulation system;
transmitting the code via a wireless link from the simulation system to the wireless receiver associated with the memory; and
storing the code in the memory.

16. The method of Claim 15 wherein said step of transmitting comprises the substep of formatting the code into a format emulating a wired connection between the simulation system and the memory.

17. The method of Claim 16 wherein the format is selected from the group comprising the PCI, RS232, IEEE 1394, USB and I2C bus protocols.

18. The method of Claim 15 wherein said step of transmitting comprises the step of transmitting the code via an RF wireless link.

19. The method of Claim 15 wherein said step of transmitting comprises the step of transmitting the code via an IR wireless link.

20. The method of Claim 15 and further comprising the step of erasing the memory of previously stored code prior to said step of transmitting.
